Practical No. 6

Aim: Write a java program demonstrating method overriding and polymorphism.

Code:

Program 1:

```
// Parent Class
class Bank {
    public double getInterestRate() {
        return 0.0; // Base rate
    }
}

// Child Class 1
class SBI extends Bank {
    @Override
    public double getInterestRate() {
        return 6.5; // SBI specific rate
    }
}

// Child Class 2
class ICICI extends Bank {
    @Override
    public double getInterestRate() {
        return 7.1; // ICICI specific rate
    }
}

public class BankPolymorphismDemo {
    public static void main(String[] args) {
        // Parent class reference pointing to child instances
        Bank bank1 = new SBI();
        Bank bank2 = new ICICI();

        System.out.println("SBI Interest Rate: " + bank1.getInterestRate() + "%");
        System.out.println("ICICI Interest Rate: " + bank2.getInterestRate() + "%");
    }
}
```

Output:
